Boom Lifts

Boom lifts are equipment that has a platform which could be lowered or raised to different heights, therefore making this piece of machinery an important necessity in a wide variety of professions. Available in quite a few specific types such as aerial platform lifts, scissor platform lifts, and knuckle boom lifts, each model operates very specifically.

The familiar aerial lift variation is normally used at snowboarding lodges to carry people who are not at ease with the ski lift. Effective in a manner analogous to that of an elevator, skiers are transported up the mountain in stages, stopping at stations along the way until they access the top. Aerial hoists are also utilized in construction, moving people safely up and down the sides of multilevel construction sites.

Scissor lifts are quite frequently utilized by utility companies as the best approach to securely facilitate staff to mend and work on cables and wires attached to poles. Phone, cable and power providers have relied on the effectiveness of this kind of boom jack for years.

The knuckle boom jack is built for use within areas of bumpy terrain and where the need to reverse direction may be required. This style of boom jack has the capability to fit in tight spots where a scissor jack cannot fit. Working amid numerous equipment in a manufacturing plant or in close proximity between two walls, the knuckle boom additionally features a standard table fitted with rails for security and employee safety.

The variety of boom jack required by corporations will normally depend on the nature of the work required. Fortunately, there are suitable designs for almost any duty.
